

T 3132 EN

Type 2469 and Type 2479 Regulators for Differential Pressure, Flow Rate and Temperature Combined Self-operated Regulators

Application

Regulators for district heating systems, heat generators, heat exchangers and other HVAC or industrial applications. For safety monitoring and safety limitation of the energy supplied to heat generators or heat exchangers.

Temperature set points from **0 to 150 °C** · Limit signals **up to 120 °C** · Valves **DN 15 to 50** · Nominal pressure **PN 25**
Suitable for liquids **up to 150 °C**

The valve **closes** when the differential pressure, flow rate or temperature **rises**.

Special features

- Low-maintenance proportional regulators requiring no auxiliary energy
- Suitable for water and other liquids or gases, provided these do not cause the materials used to corrode
- Temperature sensors for operating pressures up to 40 bar
- Particularly suitable for district heating plants according to DIN 4747-1 (AGFW requirements for components in house substations)

Combinations with Type 2403 Safety Thermostat have the same function as a safety temperature monitor (STM). With Type 2439 Safety Thermostat, they have the same function as a safety temperature limiter (STL). Regulators have extended safety specified in DIN EN 14597.

Versions

Differential pressure or flow regulators with temperature regulators

DN 15 to 50 valve made of red brass with welding ends (special versions with threaded ends or screwed-on flanges)
Nominal sizes DN 32, 40 and 50 also available with flanged valve body made of spheroidal graphite iron · Type 2430 Control Thermostat

Type 2469/2430 (Fig. 1)

Flow and temperature regulator with continuously adjustable flow set point at the integrated restriction (differential pressure across the restriction of 0.2 bar) · Installation in either flow or return flow pipes

Type 2479/2430

Differential pressure limiter and temperature regulator with flow limitation · Fixed differential pressure set point adjusted to $\Delta p = 0.2 \text{ bar}$ · Continuously adjustable flow limitation · With internal overload protection ¹⁾ (excess pressure limiter) in the actuator · Installation in return flow pipes

¹⁾ DN 15 to 25 only

Fig. 1: Type 2469/2430

Type 2469/2430/2403 Flow and Temperature Regulator and Safety Temperature Monitor (FR/TR/STM) · With Type 2469 Valve, Type 2430 Control Thermostat and Type 2403 Safety Thermostat

Type 2469/2430/2439 Flow and Temperature Regulator and Safety Temperature Limiter (FR/TR/STL) · With Type 2469 Valve, Type 2430 Control Thermostat and Type 2439 Safety Thermostat

Principle of operation (see Fig. 2 to Fig. 4)

The regulators consist of a valve, actuator and control thermostat (20) and, in some cases, also a safety thermostat (26/27).

Type 2469/2430 Flow and Temperature Regulator

The high pressure upstream of the restriction (1.2) is transmitted to the high-pressure side of the diaphragm actuator (6) through the attached control line (11). The low pressure downstream of the restriction acts on the low-pressure side of the operating diaphragm (6.1) through a hole in the valve plug (3). The differential pressure generated across the restriction is converted into a positioning force by the operating diaphragm. This force is used to move the valve plug according to the force of the set point spring (5).

The temperature of the medium creates a pressure in the sensor which is proportional to the measured temperature. This pressure is transferred to the operating bellows (23) and converted into a positioning force. This force moves the valve plug (3) according to the force of the spring (21) and the temperature set point adjustment.

The largest signal is always used to control the regulator.

Type 2479/2430 Differential Pressure Limiter and Temperature Regulator with Flow Limitation

This device is largely identical to the Type 2469/2430. It does not have a fixed control line (11). Instead, the high pressure of the plant is transmitted over a control line to be attached on installing the regulator in the pipeline. The flow limitation is adjusted at the restriction (1.2).

An overload protection (excess pressure limiter) (6.2) in the actuator of the Type 2479/2430 Regulator (DN 15 to 25 only) protects the seat and plug from overload during exceptional operating conditions that could lead to valve or plant damage.

Legend for Fig. 2 to Fig. 4

- 1 Valve body
- 1.1 Connection nut with seal and welding end
- 1.2 Restriction for adjusting the flow rate set point
- 2 Seat
- 3 Plug (balanced)
- 4 Plug stem
- 5 Differential pressure springs
- 6 Actuator
- 6.1 Operating diaphragm
- 6.2 Internal excess pressure limiter (overload protection)
- 10 Coupling nut
- 11 Control line
- 12 Set point screw
- 15 Coupling rod
- 20 Control thermostat
- 21 Spring
- 22 Set point adjuster
- 23 Operating bellows
- 24 Capillary tube
- 25 Temperature sensor

Type 2479/2430, DN 32 to 50

Type 2479/2430, DN 15 to 25

Fig. 2: Regulators for differential pressure, flow rate and temperature

Type 2469/2430/2403 Flow and Temperature Regulator and Safety Temperature Monitor (see Fig. 3)

This regulator is the same as Type 2469/2430, but additionally has a Type 2403 Safety Thermostat (26).

The valve is closed by a spring mechanism when the temperature reaches the adjusted limit, when the capillary tube breaks or when leakage occurs in the sensor system. It resets itself automatically when the fault has been remedied and the temperature has fallen below the limit. The Type 2403 Safety Thermostat is available in two versions to be selected depending on how the temperature sensor is installed (see Data Sheet ► T 2183).

Type 2469/2430/2439 Flow and Temperature Regulator and Safety Temperature Limiter (see Fig. 4)

This regulator is the same as Type 2469/2430, but additionally has a Type 2439 Safety Thermostat (27). A spring mechanism closes and locks the valve when the temperature reaches an adjusted temperature limit, when the capillary tube ruptures or there is a leak in the sensor system. The valve can only be reset and put back into operation with a tool (see Data Sheet ► T 2185).

Installation

The regulator is only suitable for installation in horizontal pipelines.

Valve

- The direction of flow must match the arrow on the valve body.
- The valve must be installed to hang downward.

Control thermostat

- The temperature sensor (with a Type 2430 Control Thermostat and Type 2439 Safety Thermostat) can be installed in any position as required.
- The installation position of the temperature sensor of the Type 2403 Safety Thermostat must be carefully observed as it depends on the sensor version.

The following generally applies:

- The entire temperature sensor must be immersed in the process medium.
- It must be installed in a location where overheating or considerable idling times cannot occur.
- The capillary tube must be run in such a way that the temperature range cannot be exceeded, any deviations in temperature cannot occur and that the tube cannot be damaged.
- The smallest permissible bending radius of the capillary tube is 50 mm.
